PROFESSIONAL SUMMARY

Software Engineer (SDE-1) with 1+ year of experience designing and delivering distributed, high-performance backend systems, real-time data pipelines, and microservices in production environments. Hands-on with Java, Node.js, Rust, WebSockets, MQTT, and open-source databases (MongoDB, PostgreSQL). Proven track record of improving system uptime, reducing latency, and automating workflows across manufacturing and enterprise domains. Experienced in Agile development, code reviews, REST API design, and end-to-end ownership of scalable services aligned with enterprise technology standards.

TECHNICAL SKILLS

Languages: Java, JavaScript/TypeScript, Node.js, Rust, Python, SQL

Frameworks & Libraries: Spring Boot, Express.js, React, Vue.js, Svelte, SvelteKit

Databases: MongoDB (Replica Sets, Change Streams), PostgreSQL, MySQL, Supabase

Protocols & Messaging: WebSockets, MQTT, WAMP, REST APIs, MongoDB Change Streams

DevOps & Tools: Git, Docker, Jest, PocketBase, Cron Jobs, Linux

Domains: Distributed Systems, Real-Time Data, Microservices, WMS, Manufacturing MES/SMT, Enterprise Backend

Familiar With : Redis, Apache Kafka, RabbitMQ

PROFESSIONAL EXPERIENCE

Software Developer Engineer – 1

Cymbeline Innovation Pvt Ltd

Mar 2025 – Present

Bengaluru, Karnataka

Panasonic Jhajjar – Real-Time Dashboard Optimization

- Replaced 5-second API polling with **WebSockets + MongoDB Change Streams**, eliminating dashboard latency and enabling zero-delay real-time updates for plant operators.
- Reduced dashboard load time from **3–5s to under 500ms** (~90% improvement), directly accelerating operator response speed on the production floor.
- Configured **MongoDB replica sets with automated failover**, increasing system uptime to **99.2%** and ensuring high availability for critical manufacturing dashboards.
- Delivered optimized dashboards improving workflow visibility for plant operations teams, enabling faster decision-making at production scale.

HMSI Traceability System – Full-Stack Development

- Engineered a **Traceability Application from scratch**, automating end-to-end production-stage tracking and eliminating manual processes across the assembly line.
- Reduced manual data entry errors by ~**75%** and improved audit efficiency by ~**40%** through automated metadata capture at each production stage.
- Built unified authentication using **PocketBase & Supabase**, reducing login issues by ~**90%** and improving team onboarding speed by ~**50%**.

Panasonic IIC – WMS Backend & Distributed Sync

- Optimized backend REST APIs handling warehouse management workflows, improving API response time by ~**40%** and overall system stability by ~**70%**.
- Executed **MQTT-based Arbitration Sync** with message forwarding across distributed nodes, achieving **99.5% inter-system communication reliability**.
- Added **cron-based scheduled sync jobs** ensuring consistent cross-system data propagation and eliminating stale-data issues in the WMS.
- Backend enhancements contributed to a ~**50% increase in WMS workflow visibility** for warehouse operations teams.

SMT Driver Microservice – Uno Minda Ketolec, Ikio, Minda Khed

- Architected a **configurable driver microservice** that ingests CSV files from SMT machines (LMM, SPI, AOI, FCR), dynamically parses heterogeneous formats per machine/client using machine metadata, and publishes enriched payloads to a **WAMP message broker**.

- Crafted a **dynamic, configuration-driven parsing engine** to handle diverse CSV schemas across multiple client factories – eliminating hardcoded parsers and enabling rapid onboarding of new machine types without code changes.
- Built a **WebSocket listener** consuming PanaCIM data (SSP, Mounters) in XML, applied class-based parsing for multiple `messageClass` types, and forwarded structured payloads to WAMP routing.
- Constructed **SMT-FileProcess in Rust** – a high-throughput file management service using async queues to copy machine CSV outputs to driver directories and archive originals, efficiently handling **10+ concurrent data streams**.

Foxconn – Backend API Development

- Planned and delivered **backend REST APIs** supporting Foxconn operational workflows, ensuring scalable, well-structured API contracts following industry best practices.

PROJECTS

Hospital Management System | *Spring Boot, React, MySQL*

- Built full-stack hospital platform covering doctor management, patient records, appointment scheduling, billing, and medical reports using **Spring Boot REST APIs** and React frontend with MySQL relational data models.

AI PDF Reader | *Python, OpenAI, HuggingFace, VectorDB, Streamlit*

- Built an intelligent document Q&A system converting PDFs to text chunks stored in a **vector database**, using LLMs (OpenAI/HuggingFace) via Streamlit for context-aware query answering.

Weather App | *React, REST APIs, Material UI*

- Created a responsive weather forecasting app integrated with OpenWeatherAPI for real-time conditions and forecasts.

EDUCATION

Channabasaveshwara Institute of Technology <i>Bachelor of Engineering, Computer Science</i>	2020 – 2024 <i>Tumkur, Karnataka</i>
Vidyanidhi PU College <i>PUC – Computer Science</i>	2018 – 2020
Sri Chaitanya Techno School <i>Secondary School (CBSE)</i>	2008 – 2018

CERTIFICATIONS & ACHIEVEMENTS

HackerRank: Java (Certificate), SQL – Basic (Certificate)
Internship: EUNOIA Labs – Software Development Intern
Events: Hackathon participant – Mysuru; Amazon AWS Workshop – Bangalore
